Experiment 1: Study of Azure

Aim:

To study the fundamentals of **Microsoft Azure** and understand its services, architecture, and features.

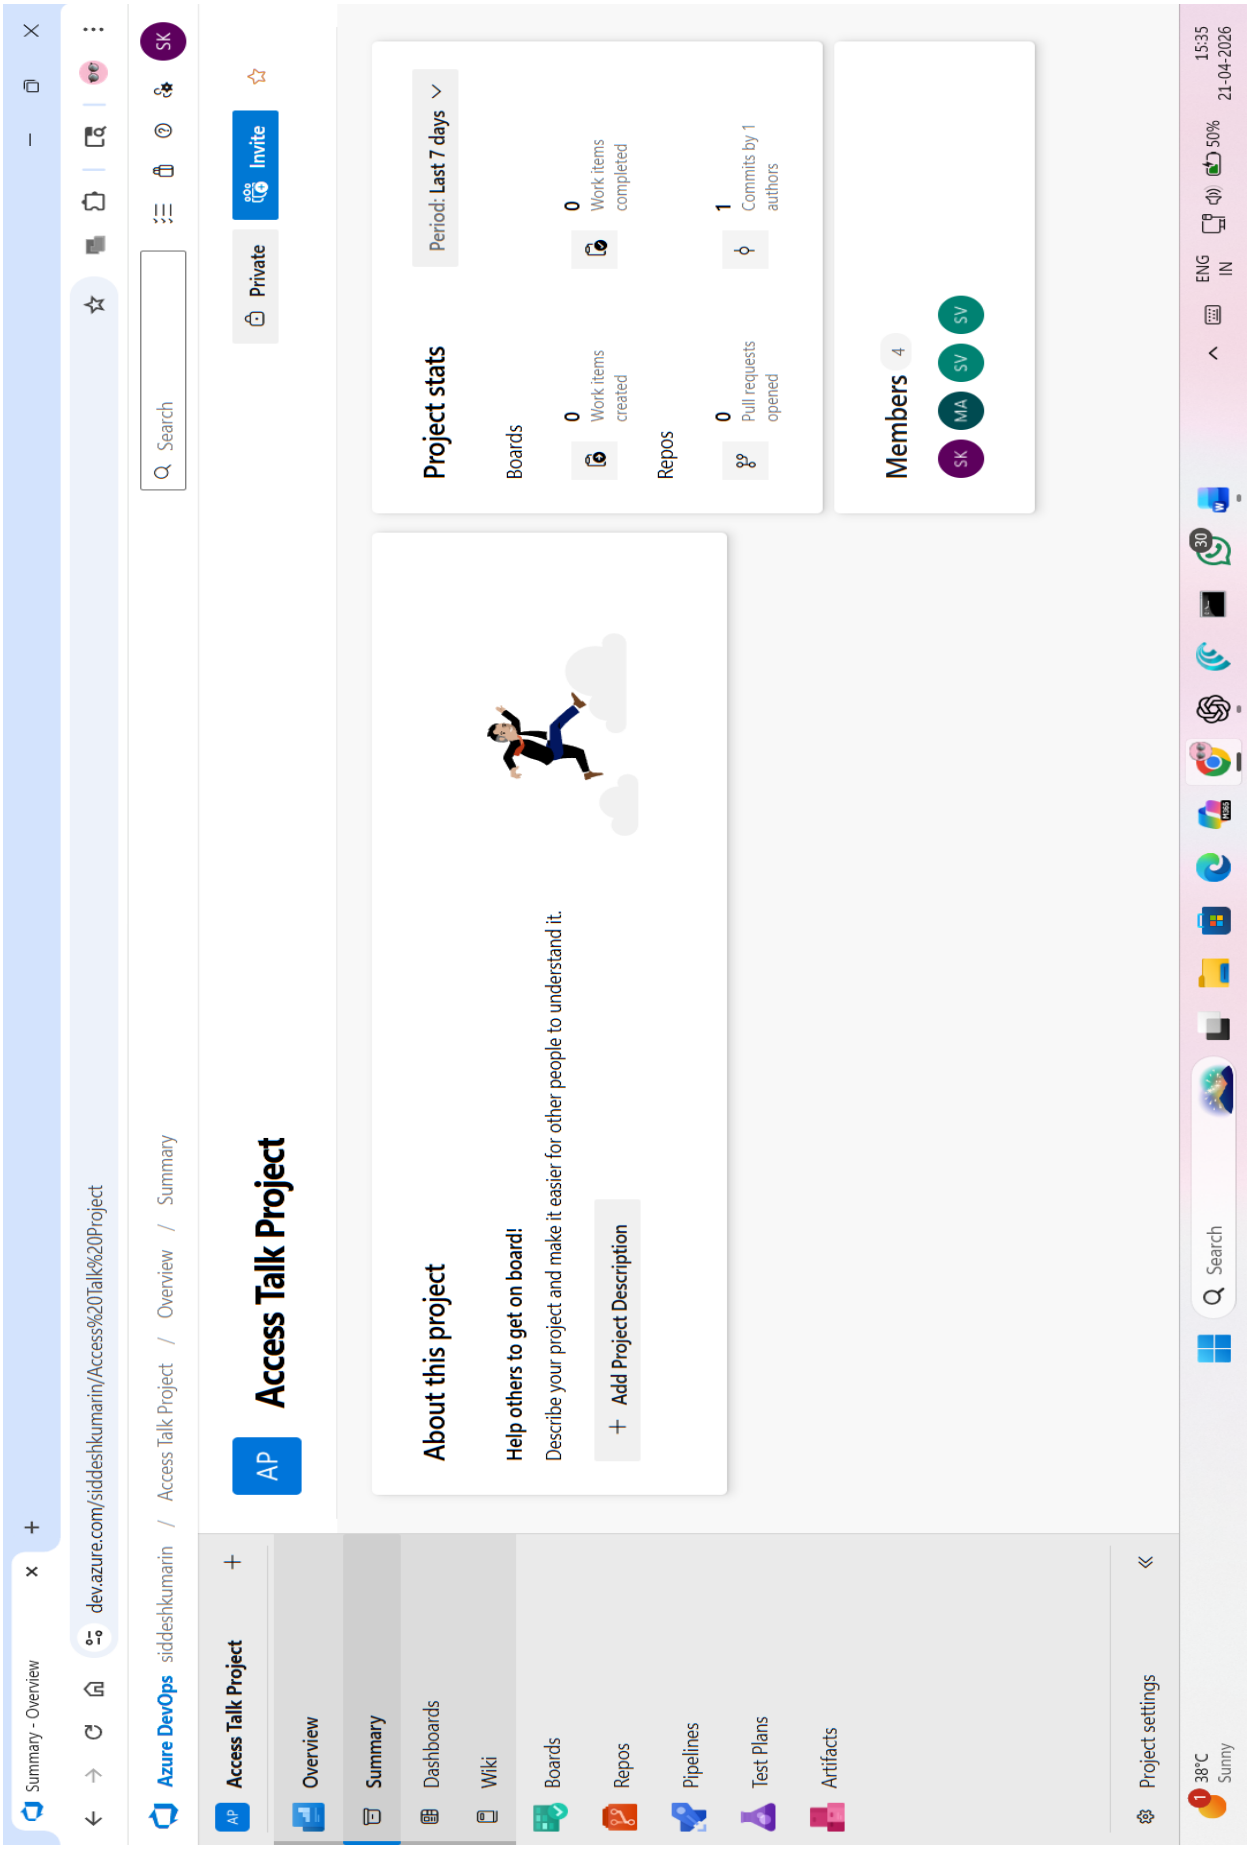
Study of Azure:

Microsoft Azure is a cloud computing platform provided by Microsoft that allows users to build, deploy, and manage applications through Microsoft-managed data centers.

Azure provides services in:

- Computing (Virtual Machines)
- Storage (Blob, Disk, Queue)
- Networking (Virtual Network, Load Balancer)
- Databases (SQL Database, Cosmos DB)
- AI & Machine Learning
- DevOps and Security

Feature / Service	**Microsoft Azure**	**Amazon Web Services (AWS)**	**Google Cloud Platform (GCP)**
Provider	Microsoft	Amazon	Google
Launch Year	2010	2006	2008
Compute Service	Virtual Machines	EC2	Compute Engine
Pricing Model	Pay-as-you-go	Pay-as-you-go	Pay-as-you-go
Global Reach	High	Very High	High
Storage Service	Blob Storage	S3	Cloud Storage
Database	Azure SQL	RDS	Cloud SQL
AI/ML Services	Azure AI	SageMaker	Vertex AI



Result

Thus, the study of Microsoft Azure was successfully completed, and its features, services, and advantages were understood
